HOW TO DELIVER SAFE TEXTILES?

Elimination of pathogen contamination from textiles is one of the relevant parameters for assessing the performance of a washing process.

Safe textiles: 4 critical factors influence the outcome of washing and the spectrum of efficacy of disinfectants:

The use of products at the recommended dosages, temperature, time and the setting of right washing conditions matter.

Dplus laundry solutions deliver different washing programs with proven efficacy on bacteria, yeasts and viruses, based on registered processes.

VAH - RKI - BPR - Local Registrations are available.

ECOLAB EMULSION with PAA based LAUNDRY DISINFECTANTS

The strong cooperation between Ecolab patented emulsion formulations and laundry bleach and disinfectants, based on PAA peracetic acid content, of the OZONIT family delivers different solutions to effectively disinfect textiles and eliminate different types of pathogens that may infect textile fibers.

We deliver different disinfection programs at different washing temperatures (from 40°C to 60°C), according to the market segment and the textiles to be washed (Hospitality, Healthcare, Long term care, Workwear).

Focus on virucidal activity: specific product combinations and use conditions have been applied for textile disinfection according to the Standard EN 14476.

The most common way of spreading **COVID-19 acute respiratory disease** is through droplets by coughing, sneezing, personal contact and touching surfaces, objects, contaminated with virus particles.

Proper cleaning and disinfection of textiles is an important part of an effective infection prevention and control program.
